Specifications

Engine

- Model : Isuzu 6WG1
- Type : 4-cycle, water-cooled, direct injection, turbo-charged, diesel engine
- Displacement : 15 681 cc
- Rated Output : 397 kW / 1 800 min⁻¹
(540 ps / 1 800 rpm)
- Fuel Tank : 800 liters
- Electrical System : 24 V D.C., 2 batteries

Notes:

- 1 Engine meets Stage / Tier 3 of current smoke emission regulations in Europe, United States and Japan.
- 2 The 397 kW engine horsepower shown above is based on an international engine horsepower rating formula that includes the horsepower necessary for engine alternator drive but excludes engine fan drive.

Control

- Control System : Control levers operate remote-controlled hydraulic servos that direct oil through six sets of tandem valves to provide comprehensive motion control.
- Control Levers : Ergonomic lever layout enables efficient operation. Joystick lever on left side controls slewing and boom hoist. Arm-chair levers on right side control hoist 1 & 2, luffing jib hoist, travel and long-mast hoist. Main winch levers are equipped with drum rotation sensors.
- Slewing Brake Pedal: Designed to be maintenance free while resisting overheating. Unique brake design of hydraulic oil control system makes it possible to smoothly initial slewing motion, even against the wind.
- Display Panel Design : Graphics on the display panel makes it easy to input the necessary operating conditions and data according to actual lifting and working conditions.

Hydraulic System

Three variable-displacement axial piston pumps and one fixed-displacement tandem gear pump provide power for independent and combined operations for all functions.

- Hydraulic Reservoir Capacity : 800 liters

Load Hoist Drums (W1, W2)

Independent bi-directional hydraulic motors provide power through a two-stage planetary reduction gear unit to drive the two main hoisting drums for hoisting and lowering operations.

Cables : 28mm dia. / 800 m long.

Boom Hoist Drum (W3)

A single bi-directional axial piston hydraulic motor powers a 3-stage planetary reduction gear unit that drives the rope drum to either hoist or lower the boom.

Cables : 28 mm dia.

Luffing Jib Hoist Drum (W4)

A single bi-directional axial piston hydraulic motor powers a 3-stage planetary reduction gear unit that drives the rope drum to either hoist or lower the luffing jib.

Cables : 28 mm dia.

Specifications

Slewing System

Slewing system is designed so that the three slewing pinions mesh with the external slewing ring gear. With this design, the external slewing gears bears the majority of the slewing torque. The system is designed to be easy to lubricate.

Counterweight

Standard 160 ton counterweight consists of a 20-ton base weight and 14 cast iron block pieces that all have the same dimensions.

Optional 180-ton weight uses two additional weights in addition to standard counterweight.

Lower Weight

50-ton weight is standard
62-ton weight is option

Side Frames

All welded structures are manufactured from high-strength steel. Each component is equipped with two steel plate hooks to make assembling on lower frame lower. Side frame is secured by removable joint pins provided on the lower frame.

- Shoe width : 1 220 mm wide is standard.
1 524 mm wide is option.
- Drive unit : 2-track drive unit per side frame.

Safety Device

- Load Moment Indicator (LMI) : The computerized system helps prevent overloads and provide safe and efficient control. Meets both EN and BS standards.
- Front-end Attachment. Erection Mode : This is an internal function of the Load Moment Indicator (LMI). It gives a warning on the LMI panel that the crane has extended beyond its intended working area. Once the work outside the intended working area is completed, the system returns automatically to resume work in the intended working range.
- Hydraulic Boom Backstops : These stops operate in conjunction with LMI to help prevent backward reaction, especially when operating with short boom lengths or against winds.
- Boom Over-hoist and Over-lowering Limiting Device : This is a combination of two systems designed to enhance operating efficiency. One system is a limit switch that is incorporated into the boom foot to prevent over hoisting. The other is a part of the LMI that prevents over-hoisting or over-lowering the boom. It includes automatic drum braking, hydraulic locks and alarm warnings.
- Drum Locks : Electrically operated pawl locks are provided as standard on all drums.

Notes

1. Capacities included in these charts are the maximum allowable, and are based on machine standing level on firm supporting surface under ideal job conditions.
2. Capacities are in metric tons, and are rated in accordance with European EN13 000 Standards in terms of machine stability and structural strength limitations. ; the figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.
3. Capacities are based on freely suspended loads and make no allowance for such factors as the effect of wind, sudden stopping of loads, supporting surface conditions, and operating speeds. Operator must reduce load ratings to take such conditions into account. Deduction from rated capacities must be made for weight of hook block, weighted ball/hook, sling, spreader bar, or other suspended gear.
4. The maximum rated load of the auxiliary sheave is the value remaining after the 2.0 ton mass of the auxiliary sheave and the mass of the "main hook" attached to the "boom" are deducted from the maximum rated load of the "Heavy Duty Boom Capacities." However, the maximum rated load of the auxiliary sheave is limited to 60 tons. The operating range of the auxiliary sheave is the range that has the maximum rated load of the main hook.
5. If the auxiliary sheave is attached, the maximum rated load of the "main hook" is the value remaining after the 2.0 ton mass of the auxiliary sheave and the mass of the auxiliary hook attached to the auxiliary sheave are deducted from the maximum rated load of the "Heavy Duty Boom Capacities."
6. The "working radius" is the horizontal distance from the slewing center to the center of gravity of a lifted load.
7. The boom tilt angle range is according to the working range diagram.
8. The chart below shows the number of reeled lines and the maximum rated loads. (When the wire rope length is 800 m.)

Notes

10. If the total mass of the hook mass and the mass of all rigging components is lighter than the mass indicated on this chart, the hook may not lower even when a lowering operation is performed. Please select a hook that can be lowered based on the boom length and number of windings.

Notes

1. Capacities included in these charts are the maximum allowable, and are based on machine standing level on firm supporting surface under ideal job conditions.
2. Capacities are in metric tons, and are rated in accordance with European EN13 000 Standards in terms of machine stability and structural strength limitations. ; the figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.
3. Capacities are based on freely suspended loads and make no allowance for such factors as the effect of wind, sudden stopping of loads, supporting surface conditions, and operating speeds. Operator must reduce load ratings to take such conditions into account. Deduction from rated capacities must be made for weight of hook block, weighted ball/hook, sling, spreader bar, or other suspended gear.
4. The maximum rated load of the auxiliary sheave is the value remaining after the 1.3 ton mass of the auxiliary sheave and the mass of the "main hook" attached to the "boom" are deducted from the maximum rated load of the "Long Range Boom Capacities." However, the maximum rated load of the auxiliary sheave is limited to 30 tons. The operating range of the auxiliary sheave is the range that has the maximum rated load of the main hook.
5. If the auxiliary sheave is attached, the maximum rated load of the "main hook" is the value remaining after the 1.3 ton mass of the auxiliary sheave and the mass of the auxiliary hook attached to the auxiliary sheave are deducted from the maximum rated load of the "Long Range Boom Capacities."
6. The "working radius" is the horizontal distance from the slewing center to the center of gravity of a lifted load.
7. The boom tilt angle range is according to the working range diagram.
8. The chart below shows the number of reeled lines and the maximum rated loads. (When the wire rope length is 800 m.)

Hook Capacity (ton)		Hook Weight (ton)	Maximum Rated Load (ton)										
			11 X 2Falls	10 X 2Falls	9 X 2Falls	8 X 2Falls	7 X 2Falls	6 X 2Falls	5 X 2Falls

Notes

10. If the total mass of the hook mass and the mass of all rigging components is lighter than the mass indicated on this chart, the hook may not lower even when a lowering operation is performed.

Please select a hook that can be lowered based on the boom length and number of windings.

Notes

1. Capacities included in these charts are the maximum allowable, and are based on machine standing level on firm supporting surface under ideal job conditions.
2. Capacities are in metric tons, and are rated in accordance with European EN13000 Standards in terms of machine stability and structural strength limitations. ; the figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.
3. Capacities are based on freely suspended loads and make no allowance for such factors as the effect of wind, sudden stopping of loads, supporting surface conditions, and operating speeds. Operator must reduce load ratings to take such conditions into account. Deduction from rated capacities must be made for weight of hook block, weighted ball/hook, sling, spreader bar, or other suspended gear.
4. The maximum rated load of the auxiliary sheave is the value remaining after the mass of the "main hook" attached to the "Heavy Duty Auxiliary Tip Extension" are deducted from the maximum rated load of the "Heavy Duty Auxiliary Tip Extension Capacities." However, the maximum rated load of the auxiliary sheave is limited to 15 tons. The operating range of the auxiliary sheave is the range that has the maximum rated load of the main hook.
5. If the auxiliary hook is attached to the Auxiliary sheave, the maximum rated load of the "main hook" is the value remaining after the mass of the auxiliary hook are deducted from the maximum rated load of the "Heavy Duty Auxiliary Tip Extension Capacities."
6. The "working radius" is the horizontal distance from the slewing center to the center of gravity of a lifted load.
7. The boom tilt angle range is according to the working range diagram.
8. The chart below shows the number of reeled lines and the maximum rated loads. (When the wire rope length is 800 m.)

Hook Capacity (ton)		Hook Weight (ton)	Maximum Rated Load (ton)						
			7 X 2 Falls	6 X 2 Falls	5 X 2 Falls	4 X 2 Falls	3 X 2 Falls	2 X 2 Falls	1 X 2 Falls
160	Single-Reeling	3.9	100	90	76	-	-	-	-
65	Single-Reeling	*3.0 / 2.0	-	-	65	61	46	31	-
15	Single-Reeling	1.0	-	-	-	-	-	-	-

* : With auxiliary weights / Without auxiliary weights

9. The chart below shows the operable windings based on the length of each boom.

Hook Capacity (ton) / Boom Length (m)		66	72	78	84	90	96
160	Single-Reeling	Max.	7	7	7	7	6
		Min.	5	5	5	5	5
65	Single-Reeling	Max.	5	5	5	5	5
		Min.	2	2	2	2	2
15	Single-Reeling	-	-	-	-	-	-

10. If the total mass of the hook mass and the mass of all rigging components is lighter than the mass indicated on this chart, the hook may not lower even when a lowering operation is performed. Please select a hook that can be lowered based on the boom length and number of windings.

Boom Length / Number of reeled lines	1 Fall	2 Falls	3 Falls	4 Falls	5 Falls	6 Falls	7 Falls
66 m	1.0	2.0	2.0	2.0	2.0	3.9	3.9
72 m	1.0	2.0	2.0	2.0	2.1	3.9	3.9
78 m	1.0	2.0	2.0	2.0	2.3	3.9	3.9

Notes

- Capacities included in these charts are the maximum allowable, and are based on machine standing level on firm supporting surface under ideal job conditions.
- Capacities are in metric tons, and are rated in accordance with European EN13 000 Standards in terms of machine stability and structural strength limitations. ; the figures surrounded by bold lines are based on factors other than those which would cause a tipping condition.
- Capacities are based on freely suspended loads and make no allowance for such factors as the effect of wind, sudden stopping of loads, supporting surface conditions, and operating speeds. Operator must reduce load ratings to take such conditions into account. Deduction from rated capacities must be made for weight of hook block, weighted ball/hook, sling, spreader bar, or other suspended gear.
- The maximum rated load of the auxiliary sheave is the value remaining after the 1.3 ton mass of the auxiliary sheave and the mass of the "luffing jib hook" attached to the "luffing jib" are deducted from the maximum rated load of the "Luffing Jib Capacities." However, the maximum rated load of the auxiliary sheave is limited to 30 tons. The operating range of the auxiliary sheave is the range that has the maximum rated load of the luffing jib hook.
- If the auxiliary sheave is attached, the maximum rated load of the "luffing jib hook" is the value remaining after the 1.3 ton mass of the auxiliary sheave and the mass of the auxiliary hook attached to the auxiliary sheave are deducted from the maximum rated load of the "Luffing Jib Capacities."
- If the heavy head sheave block is attached, the maximum rated load of the "luffing jib hook" is the value remaining after the 3.0 ton mass of the heavy head sheave block and the mass of the "luffing boom hook" attached to the heavy head sheave block are deducted from the "Luffing jib Maximum Rated Load" value.
- The "working radius" is the horizontal distance from the slewing center to the center of gravity of a lifted load
- Luffing Boom and Luffing Jib tilt angle ranges are according to the working range diagram.
- The chart below shows the number of reeled lines and the maximum rated loads. (When the wire rope length is 800 m.)

Hook Capacity (ton)		Hook Weight (ton)	Maximum Rated Load (ton)												
			8 X 2Falls	7 X 2Falls	6 X 2Falls	5 X 2Falls

11. If the total mass of the hook mass and the mass of all rigging components is lighter than the mass indicated on this chart, the hook may not lower even when a lowering operation is performed.

Please select a hook that can be lowered based on the boom length and number of windings.

15 t hook	1		950

Standard Equipment

Undercarriage

- 1 220 mm wide track shoes
- Side frame removal device
- Auto-greasers (for upper and lower track rollers)
- Lower jack-up device
- Floats (Pontoons)
- Drive tumbler tension adjusting devices
- Steps
- Level gauge

Superstructure

- The engine meets Stage / Tier 3 of current smoke emission regulations in Europe, America and Japan.
- Live mast assy. (include sheaves and links)
- Live mast flip cylinders
- Load hoist drums (W1 and W2)
- Boom hoist drum (W3)
- Auto-greasers (for T.T.B.)
- Engine room under-cover
- Two 70W working lights
- Rear view mirror (Right side)
- Ladder (Left and Right side)
- Std. spare parts and tools

Counterweights

- 160 t counterweights ; 10t counterweight X 14 pcs. with base counterweight.
- 50 t lower counterweight

Cabin

- 1 200 mm wide, full-vision operator's cab
- Cab swing device
- Cab tilt device(0-15°)
- Cab sidestep
- Joystick lever (for slewing and boom hoist drum)
- Armchair control lever (for load hoist and jib hoist drums)
- Drum indicator (Load hoist and Boom hoist drum)
- Speed control device (Load hoist, Boom hoist and Slewing)
- Foot throttle
- Slewing brake pedal
- 24 V electric outlet
- A reinforced light green-tinted safety glass
- Cab under-cover
- Air-conditioner
- Dual intermittent window shield wipers with washers
- Sunshade
- Sunvisor
- AM / FM Radio w / clock
- Cab floor mat
- Cigar lighter
- Ashtray
- Cup Holder
- Room light
- Level gauge

Safety Device

- Load Moment Indicator
- Control lever position check monitor
- Front-end att. erection mode
- Lock lever : Fool proof shut-off system
- Automatic drum pawl locks (W1, W2, W3, W4)
- Control lever locks
- Speed slowdown device
- Emergency engine stop switch
- Hydraulic cylinder type Boom backstops
- Boom over-hoist and -lowering limiting device
- Dual boom over-hoist limiting device (Back stop limit switch)
- Hook over-hoist limiting device
- Non-drum brake preventing device
- Slewing brake safety circuit
- Slewing brake lamp
- Slewing alarm
- Travel alarm
- Lifting height meter

Liftcrane Attachment

- 24 m heavy duty basic boom
- Hydraulic cylinder type boom backstops
- Hook over-hoist limiting device
- Right boom extension assembling plate
- Boom angle indicator

Luffing Attachment

- 24 m heavy duty basic boom
- 24 m basic luffing jib
- W4(luffing jib hoist) winch and wire rope
- Hydraulic cylinder type boom backstops
- Luffing jib backstops
- Hook over-hoist limiting device
- Luffing jib over-hoist and -lowering limiting device
- Dual luffing jib over-hoist limiting device
- Right boom extension assembling plate

Optional Equipment
